How To Deploy Changes of Application

Deploying Server Changes

When the server code is updated and you want to deploy any changes, you will need to use the [Heroku CLI](#)

You will also need to ensure you have [Docker](#) and the Docker CLI configured.

first login to the cli by running: `heroku login` and following the instructions to log in via the web. Shared Heroku credentials are in the Google Drive.

Next, go to the `server/` directory in the project

run:

```
# login to the specific container
heroku container:login

# uses Docker and the Dockerfile to build an image of the server
and send it to the container
heroku container:push web

# releases the pushed changes for deployment
heroku container:release web
```

All done!

Deploying Client Changes

When the client code is updated and you want to deploy any changes, simply go to the `client/` directory in the project and run `npm run deploy`, give it a few minutes to allow the changes to propogate.
